Overview**Design****History****Formats****Uses****Performance****Lifespan****Safety****Generally**, the negative electrode of a conventional lithium-ion cell is graphite made from carbon. The positive electrode is typically a metal oxide or phosphate. The electrolyte is a lithium salt in an organic solvent. The negative electrode (which is the anode when the cell is discharging) and the positive electrode (which is the cathode when discharging) are prevented from shorting by a separator. The el...

The lithium-ion cells can be either cylindrical batteries that look almost identical to AA cells, or they can be prismatic, which means they are square or rectangular The computer, which comprises;; One or more temperature sensors to monitor the battery temperature; A voltage converter and regulator circuit to maintain safe levels of voltage and current

The anodes of most lithium-ion batteries are made from graphite. Typically, the mineral composition of the cathode is what changes, making the difference between battery chemistries. The cathode material typically contains lithium along with other minerals including nickel, manganese, cobalt, or iron.
