Every solar energy system is composed of various important components, and one of these important components is solar microinverter. Essentially speaking, the solar microinverter, or simply known as microinverter, is a plug-and-play device that converts direct current (DC) to alternating current (AC).

A microinverter is a very small inverter designed to be attached to each individual solar panel. This is very different to standard string solar inverters, which are usually located on a wall some distance from the string of solar panels and connected via DC cable. In string inverter systems, DC power from the string of the panels is then converted to AC at the inverter.

With microinverters, each solar panel has its own inverter, while string inverters handle power from a group of panels. Each type has its pros and cons. For example, microinverters offer better performance and are more efficient, but can be more expensive than string inverters. In a nutshell, here's what to remember:

Disadvantages of power optimisers: Again like micro-inverters, they'll add around 15% to your system cost. The array is still matched to the inverter's power rating, so you typically can't just add more panels later. Enphase micro-inverters.
