Definition: UPS is an acronym of Uninterruptible Power Supply, it is an electronic device which is used to supply power to other devices such as a computer, telecommunication equipment etc. in case of power outage.. The rectifier present in the UPS converts the AC power into DC, then the battery stores the DC power. This process continues when the AC power is on.

This system works by first converting incoming AC power to DC power, and then re-converting it back from DC power to "good" AC power. This process ensures that the system is immune to the irregularities in the main supply and delivers clean and uninterrupted power. Top 4 Benefits of UPS Systems 1. Prevents Damage to Electrical Equipment
