This paper presents the Application Specific Integrated Circuit (ASIC) implementation of the digital protective relays in power distribution system. It was achieved using Electric Design Automation (EDA) techniques. This design was simulated and then implemented into two Field Programmable Gate Arrays (FPGAs). The complete protective relay including the data acquisition, data ...

Digital protective systems operate in an entirely different manner than traditional systems. They are provided with a series of samples of the measured signal, spaced timewise according to a predetermined sampling rate (for example, a comparator can be designed to behave like a distance relay).

This paper presents a unified power signal processor (PSP) for use in various applications in power systems. The introduced PSP is capable of providing a large number of signals and pieces of information which are frequently required for control, protection, status evaluation, and power quality monitoring of power systems.

Download Fundamentals of Power System Protection By Y.G. Paithankar, S.R. Bhide - A power system is an electrical network responsible for supplying and transmitting power. It's through such a system that homes

and industries in a region receive power. Protection schemes have to be devised for these power systems, so that damage to life and property [...]
