Economic dispatch (ED) is at the heart of economic operation of a power system. In addition to maintaining the system reliability, meeting the forecasted system load at the lowest possible cost is one of the key goals in power system operation. The ED problem primarily depends on the generating unit cost function.

The economic operation of a power system is studied using an approximation of the active power losses for estimating the penalty factor of the generation nodes while the generation cost is taken as a quadratic function of the active power. Then, the optimum allocation of active power generation can be calculated for minimum generation cost.

Optimum Economic Operation of Power Systems Considering Transmission Losses: To introduce the complexity of transmission losses, let us consider the simplest possible example. Let one unit (or plant) be connected to a bus that also supplies the one-system load and let another unit (or plant) feed the same bus over a transmission line. Now when ...
