Transferring AC/DC electrical power. Electrical distribution systems are an essential part of the electrical power system. In order to transfer electrical power from an alternating current (AC) or a direct current (DC) source to the place where it will be used, some type of distribution network must be utilized.

Like any other industry, the electric power system may be thought of as consisting of three main divisions: 1. manufacture, production or generation, cogeneration, 2. delivery or transmission ...

1.1 Introduction to Electric Power Supply Systems Electric power supply system in a country comprises of generating units that produce electric- ... distribution of power is raised from 11 kV to 33 kV, the voltage drop would be lower by a factor  $1/3$  and the line loss would be lower by a factor  $(1/3)^2$  i.e.,  $1/9$ . Lower voltage transmission

simplified AC electrical power distribution system consists of an electric generation source, transformers to change voltages, conductors, and switchgear for protection and control. The system should be designed to safely generate electrical power and safely transport that power to its point of use.

Electric power distribution is the portion of the power delivery infrastructure that takes the electricity from the highly meshed, high-voltage transmission circuits and delivers it to customers. Some also think of distribution as anything that is radial or anything that is below 35 kV.

functions that are discussed in detail in "Electric Power Systems: Design and Analysis" such as Power Flow, Stability, optimal operation of power systems, are discussed briefly in this chapter. Chapter 9 is new to this book, and offers a brief discussion of the Present and Future of Electric Energy Systems.
