

Overcurrent protection schemes are generally designed with a primary means of clearing a fault, as well as one or more backup methods. Where possible, it is preferred that instantaneous methods of detecting overcurrent be used as the primary protection method on all of the major equipment associated with the power system.

3. PROTECTION SETTINGS: INTRODUCTION A power system is composed of a number of sections (equipment) such as generator, transformer, bus bar and transmission line. These sections are protected by protective relaying systems comprising of instrument transformers (ITs), protective relays, circuit breakers (CBs) and communication equipment. In ...
