

A most interesting and challenging goal in lithium-ion battery technology is the development of high capacity electrode materials that will increase a battery's energy density, ...

This Special Issue on "Electrode Materials for Rechargeable Lithium Batteries" will be focused on various novel high-performance anode and cathode materials for RLBs, including aspects ranging from material design to fabrication technology, scientific ...

Lithium insertion materials suitable for negative and positive insertion electrodes are reviewed. Future trends, such as alternative materials for achieving higher specific charges--the Figure shows a scheme for reversible lithium storage in a high specific charge carbonaceous material--are discussed.

This study describes new and promising electrode materials, Li_3NbO_4 -based electrode materials, which are used for high-energy rechargeable lithium batteries. Although its crystal structure is classified as a cation-disordered rocksalt-type structure, lithium ions quickly migrate in percolative network in bulk without a sacrifice in kinetics.

a, The room-temperature voltage composition profile for a $\text{Cu}_{2.33}\text{V}_4\text{O}_{11}/\text{Li}$ cell cycled at a C/5 rate (1 Li in 5 h) between 1.5 and 3.5 V indicates a reversible redox process involving 5.5 Li ...

Rechargeable lithium batteries have rapidly risen to prominence as fundamental devices for green and sustainable energy development. ... coupled with solid-state redox of transition metals, which is the basic theory used for classic lithium insertion materials, such as LiMeO_2 (Me = Co^{3+} , Ni^{3+} , etc.). ... is first examined as the host ...

Organic compounds offer new possibilities for high energy/power density, cost-effective, environmentally friendly, and functional rechargeable lithium batteries. For a long time, they have not constituted an important class of electrode materials, partly because of the large success and rapid development of inorganic intercalation compounds.

Numerous insertion/intercalation materials have been proposed for positive electrodes of rechargeable batteries [44]. 2 Most of the work was devoted to the insertion of lithium and other alkali metal ions into host materials (see, for example, other contributions to this volume, conference proceedings [45], [46], recent reviews [40], [47], and ...

Therefore, it is necessary for electrode materials to comply with the standards as follows: (1) showing rapid reaction kinetics for lithium ions and electrons; (2) having an excellent ionic diffusivity together with a high electronic conductivity; (3) possessing a short path for lithium-ion diffusion and electron transfer; (4) remaining as a ...

Layered $\text{LiCo}_{1/3}\text{Ni}_{1/3}\text{Mn}_{1/3}\text{O}_2$ was prepared by a solid state reaction at $1000\text{ }^\circ\text{C}$ in air and examined in nonaqueous lithium cells. $\text{LiCo}_{1/3}\text{Ni}_{1/3}\text{Mn}_{1/3}\text{O}_2$ showed a rechargeable capacity of 150 mAh g^{-1} in $3.5\text{--}4.2\text{ V}$ or 200 mAh g^{-1} in $3.5\text{--}5.0\text{ V}$. Operating voltage of $\text{Li} / \text{LiCo}_{1/3}\text{Ni}_{1/3}\text{Mn}_{1/3}\text{O}_2$ was by $0.2\text{--}0.25\text{ V}$ lower than that of a cell with LiCoO_2 or LiMn_2O_4 ...

Great efforts have been made in developing high-performance electrode materials for rechargeable batteries. ... Since Goodenough et al. reported spinel LiMn_2O_4 as a cathode material for lithium-ion batteries in 1983, ... and exhibit short lithium insertion distances. Based on the simple nanowires, the porous nanowires and nanowire arrays are ...

Currently, lithium ion batteries (LIBs) have been widely used in the fields of electric vehicles and mobile devices due to their superior energy density, multiple cycles, and relatively low cost [1, 2]. To this day, LIBs are still undergoing continuous innovation and exploration, and designing novel LIBs materials to improve battery performance is one of the most popular ...

MoS_2 and TiS_2 are two main sulfides as insertion electrodes since they were formerly regarded as good cathode materials for Li-metal rechargeable batteries. Of course, their reversibility for lithium insertion and removal is very good and their voltage is about 2 V (vs. Li/Li^+).

In terms of the positive electrode, which is also called as cathode, during the charge process, whether lithium metal or graphite is used as the reference electrode, lithium ions move from the positive electrode, electrons also lose via the outside circuit, and potential of the insertion electrode or the voltage of the battery increases.

a, Overview of important milestones in the development of rechargeable metal batteries from left to right: Bolloré; Blue Solutions, zinc intercalation in $\alpha\text{-MnO}_2$ (ref. 7), Ca intercalation in TiS_2 ...

In this paper, we review the main progresses obtained by DFT calculations in the electrode materials of rechargeable lithium batteries, aiming at a better understanding of the ...

In the past four decades, various lithium-containing transition metal oxides have been discovered as positive electrode materials for LIBs. LiCoO_2 is a layered oxide that can electrochemically extract and insert Li-ions for charge compensation of $\text{Co}^{3+}/\text{Co}^{4+}$ redox reaction and has been widely used from firstly commercialized LIBs to state-of-the-art ones [1].

Rechargeable lithium batteries involve a reversible insertion/extraction of lithium ions into/from a host electrode material during the charge/discharge process. The lithium insertion/extraction process occurring with a flow of ions through the electrolyte is accompanied by a reduction/oxidation (redox) reaction of the host matrix assisted with ...

Insertion electrode materials for rechargeable lithium batteries

There is growing demand for powering portable electronic devices to electric vehicles in recent years. The inconsistent output of renewable energy sources and the rise of electric vehicles further its demand to improve and innovate on energy storage materials [3, 12]. Rechargeable batteries, including lithium-ion (Li-ion) and sodium-ion (Na-ion) batteries and ...

Lithium insertion materials suitable for negative and positive insertion electrodes are reviewed. Future trends, such as alternative materials for achieving higher specific charges--the Figure shows a scheme for reversible lithium storage in a high specific charge carbonaceous ...

In insertion/de-insertion applications, several materials based on carbon such as single and multiwall carbon nanotubes, graphene, graphite, porous carbon, and hard carbon have been tested. ... Another promising positive electrode material for lithium-based battery is sulphur. ... For rechargeable battery electrode materials, different ...

Understanding Conversion-Type Electrodes for Lithium Rechargeable Batteries. ... both of which depend on intercalation/insertion of lithium ions for operation. While the cathode material currently limits the battery capacity and overall energy density, there is a great deal of interest in the development of high-capacity cathode materials as ...

Cathode electrodes in rechargeable Li batteries store Li + and electrons by the concurrent insertion of Li + in a crystal structure and the reduction of a transition-metal ion (1).

Abstract Dealloying has been recognized as a universal strategy to fabricate various functional electrode materials with open networks, nanoscale ligaments, tunable pore sizes and rich surface chemistry, all of which are very attractive characteristics for rechargeable lithium batteries. In particular, lithium ion insertion/extraction in metal anodes is naturally ...

Reversible extraction of lithium from (triphylite) and insertion of lithium into at 3.5 V vs. lithium at 0.05 mA/cm² shows this material to be an excellent candidate for the cathode of a low ...

Background. In 2010, the rechargeable lithium ion battery market reached ~\$11 billion and continues to grow. 1 Current demand for lithium batteries is dominated by the portable electronics and power tool industries, but emerging automotive applications such as electric vehicles (EVs) and plug-in hybrid electric vehicles (PHEVs) are now claiming a share.

New Lithium Insertion Alloy Electrode Materials for Rechargeable Lithium Batteries ... A most interesting and challenging goal in lithium-ion battery technology is the development of high capacity electrode materials that will increase a battery's energy density, e.g., using metals and alloys that have almost double the volumetric capacity of ...

Insertion electrode materials for rechargeable lithium batteries

To further increase the versatility of Li-ion batteries, considerable research efforts have been devoted to developing a new class of Li insertion materials, which can reversibly store Li-ions in host structures and are used for positive/negative electrode materials of Li-ion batteries.

This study describes new and promising electrode materials, Li₃NbO₄-based electrode materials, which are used for high-energy rechargeable lithium batteries. Although ...

Compared with current intercalation electrode materials, conversion-type materials with high specific capacity are promising for future battery technology [10, 14]. The rational matching of cathode and anode materials can potentially satisfy the present and future demands of high energy and power density (Figure 1(c)) [15, 16]. For instance, the battery systems with ...
