A flow battery contains liquid phase electrodes separated by an ion-permeable membrane. Liquid solutions of redoxactive species are pumped into the cell for charging and discharging and return to external storage tank afterwards. Traditional enclosed batteries are not able to maintain discharge at peak for sufficiently long duration to adequately regulate wind or solar power output.

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.
