

ly distort the interferogram. In general, the output signal of a PC or PV MCT detector will remain a linear function of the incident flux so long as the photogenerated electron-hole concentration  $n$  in the absorber layer is sufficiently small compared to the steady-state

**PHOTOVOLTAIC DETECTORS IN MCT** It was 41 years ago that the first report of the synthesis of the semi metal HgTe and the wide-band-gap semiconductor CdTe to form the semiconductor alloy MCT was published by the Royal Radar Est

the detector. This reverse bias will increase the effective shunt impedance of the detector but will also increase the detector  $1/F$  noise. Advantages of Photovoltaic MCT Unlike the MCT photoconductors commonly used in the 750nm to 5.5 $\mu$ m region, MCT photodiodes operate in the photovoltaic mode and can operate at zero bias. J19 detectors are a ...

Left: Non-cooled type and TE-cooled type photoconductive MCT detector, continuous operation cutoff wavelength: 5.4 mm, ... In contrast, photovoltaic detectors are p-n junction diodes operating under reverse bias conditions, and thus have high impedance and very low power dissipation, which provides an excellent device structure for ...

Explore high-performance MCT detectors and photovoltaic sensors at VIGO Photonics. Our advanced technology ensures superior precision and sensitivity. Elevate your applications with our cutting-edge detectors and sensors.

There are a growing number of infrared photovoltaic 2D focal plane array (FPA) detectors commercially available for integration into high performance infrared cameras. Sensor materials include indium gallium arsenide (InGaAs), quantum well infrared photodetector (QWIP), indium antimonide (InSb) and mercury cadmium telluride (MCT).

Our MCT detectors with and without TEC are offered in TO-8 or TO-39 packages, respectively. We also incorporate the VML8T0 and VML10T0 detectors in our PDAVJ Series Amplified Photodetectors.

nd silicon multiplexer chips gure 1 compares the three different types of MCT infrared detector that have been technologically significant over the past 40 years: the photovoltaic (PV) detector (or photodiode), the photoconductive (PC) detector, and the metal-insulator-semiconductor (MIS)

These photodiodes operate in photovoltaic mode and provide coverage for Mid-IR wavelengths through 10.6 $\mu$ m. The detectors are optimized for best performance at a specific wavelength (5.0 $\mu$ m, 8.0 $\mu$ m, or 10.6 $\mu$ m). Each HgCdTe (MCT) sensor element is ...

In conclusion, a transmissive polarization-independent dielectric meta-lens is proposed to monolithically

integrate with a HgCdTe infrared photodetector to concentrate ...

The four photovoltaic detectors including different types of material structures of InSb, MCT and T2SL in both MWIR and LWIR bands, operating temperature including RT, 230 K and 77 K. Detailed information of the DUT are summarized in Table.1. Normally, for photocurrent measurement the DUT are connected to FTIR spectrometer through an external ...

Thorlabs" Amplified HgCdTe (mercury cadmium telluride, MCT) Photovoltaic Detectors are sensitive to MIR light. A rotary switch controls the gain amplifier (shown in the photo below), allowing performance to be optimized for a variety of applications. The gain switch features eight discrete steps from 0 to 30 dB (Item #s PDAVJ8 and PDAVJ10) or 0 ...

J15TE Series Thermoelectrically Cooled MCT Detectors. J15TE Series "Short-Wave" detectors are photoconductive HgCdTe elements on thermoelectric coolers. They are designed for industrial and military applications that require good sensitivity in the 2 to 5  $\mu\text{m}$  wavelength region without liquid nitrogen cooling.

Mid-IR Photovoltaic Detectors, HgCdTe (MCT) HgCdTe (MCT) Detectors with Optically Immersed Sensors; Models Available with Four-Stage TEC; Available in TO-8 or TO-39 Package; VL5T0. 2.7 - 5.0  $\mu\text{m}$  Wavelength Range, TO-39 Package. VML10T4. 2.0 - 10.6  $\mu\text{m}$  Wavelength Range with Thermoelectric Cooling,

2.4 - 6.4  $\mu\text{m}$ , ambient temperature, optically immersed PVI-6 is uncooled IR photovoltaic detector based on sophisticated HgCdTe heterostructure for the best performance and stability, optically immersed in order to improve parameters of the device. The detector is optimized for the maximum performance at  $\lambda_{\text{opt}} = 6.0 \mu\text{m}$ . Cut-on wavelength can be optimized upon request. ...

For its range of PV/PVI/PVM/PVMI/PEM/PEMI HgCdTe (MCT) photovoltaic detectors, Vigo System provides a broad range of selected line or configurable line infrared (IR) detection modules that integrate the IR photodetector with the preamplifier and - depending on the module series - also signal processing electronics, optics, heat dissipation ...

Materials used for infrared detectors in recent years are HgCdTe, InSb, InGaAs, Si:X, QWIP and InAs/GaSb T2 SL, of which HgCdTe is a ternary compound, an alloy of CdTe and HgTe ratios [] is an ideal infrared detector material with a large adjustable range, and the forbidden band width can cover an energy range of 0.1-1.0 eV with the change of material ...

The MCT photovoltaic detector is coupled to an internal DC to 20 MHz bandwidth transimpedance amplifier. The output can be ordered either as DC or AC. Detector size is 1mm x 1mm. The broadband  $D^*$  is greater than  $1 \times 10^{10}$  Jones. The side looking LN2 pour filled dewar has a 12 hour hold time.

# Mct photovoltaic detector

Concerning a HgCdTe detector with a pitch size of 40 mm &#215; 40 mm, when the photosensitive area is reduced to 5 mm &#215; 5 mm, the meta-lens could still keep the light absorptance above 50%, which ...

MCT properties, growth methods and characterization. Randolph E. Longshore, in Handbook of Infra-red Detection Technologies, 2002 7.1 Preface. Mercury Cadmium Telluride (MCT) is a very important semiconducting material developed over the past 44 years. MCT is used to fabricate infrared (IR) detectors for military and scientific applications.

PVI-4TE-3-1x1-TO8-wAl 2 O 3-36 and PVI-4TE-3-1x1-TO66-wAl 2 O 3-36 are four-stage thermoelectrically cooled (4TE) photovoltaic IR detectors based on HgCdTe heterostructures for optimal performance and stability, optically immersed to enhance the parameters. Their specific wavelength (l spec) is 3.0 &#181;m and their optical area (A o) is 1 mm &#215; 1 mm. The cut-on ...

For many years mercury cadmium telluride (MCT) has been the material of choice for high performance infrared optical detectors.<sup>1,2</sup> The ability to tune the bandgap combined with the recent and rapid maturation of MCT molecular beam epitaxy (MBE) technology<sup>3-5</sup> have helped to cement MCT in the mainstream of IR focal plane array technology ...

MCT Photovoltaic detectors The packages of cooled detectors (TO8, TO66) are filled with dry, heavy noble gases for low thermal conductivity (Kr/Xe mixtures). Water vapor condensation is prevented by careful sealing and water absorbers applied inside the package. The packages are hermetically sealed with IR windows. DETECTOR PACKAGES TO8 ...

2.2 - 4.2 &#181;m, four-stage thermoelectrically cooled, optically immersed PVI-4TE-4 is four-stage thermoelectrically cooled IR photovoltaic detector based on sophisticated HgCdTe heterostructure for the best performance and stability, optically immersed in order to improve parameters of the device. The detector is optimized for the maximum performance at  $l_{opt} = 4.0$  mm. Cut-on ...

2.5 - 6.5 &#181;m, ambient temperature. PV-6 is uncooled IR photovoltaic detector based on sophisticated HgCdTe heterostructure for the best performance and stability. The device is optimized for the maximum performance at  $l_{opt} = 6.0$  ...

MCT detector is an infrared detector with tunable bandgap in which the detection structure is made of mercury, cadmium and telluride, also known as the HgCdTe detector. It is a semiconductor electro-optical device that converts infrared radiation into an electrical signal. What are the advantages of using HgCdTe detectors in various applications?

HgCdTe (MCT) photoconductive detectors >2 Broad 1 - 16 &#181;m spectral range > Active area from 25&#215;25 &#181;m<sup>2</sup> to 4&#215;4 mm > High detectivity > Low speed > Long lifetime and MTBF > Stability and reliability > 1/f noise > Uncooled and TE cooled > Immersion microlens technology available  
HgCdTe (MCT) photovoltaic detectors
