Among the various drug delivery routes, the oral route has long been the most popular and convenient route. In this chapter, we focus on the development of oral solid dosage forms including ...

Oral solid dose (OSD) drugs are pharmaceutical preparations for oral administration in tablets, capsules, powders, or granules. They are mainly prescribed due to their convenience, ease of administration, and long shelf-life, ...

"Although solid dose is a mature dosage form, oral solid-dose services for poorly soluble or modified-release products--such as tablet coating and enhanced delivery or solubility--are highly valued. ... Velesco Pharma, a provider of early- and late-stage drug-development services, began operations at its new cGMP clinical manufacturing ...

The oral solid dose form continues to play a major role in the contract manufacturing industry, representing

about 60% of the market. After a period of uncertainty, the solid dose market is set for a new period of gradual expansion. Solid dose manufacturing and oral delivery of new drug candidates, reformulation of existing molecules, fixed dose

The company has the expertise and capability to work with formulations for new chemical entities (NCEs), improve products with existing drug substances, development of generics, and support all phases of clinical development. Recipharm offers a range of manufacturing capabilities to meet the specific needs of any product, from wet or fluid-bed ...

Oral Solid Dose Flexible and integrated solutions for tablet and capsule manufacturing Oral solid dose (OSD) continues to be the dominant dosage form for pharmaceutical therapeutics with drug developers and manufacturers innovating to develop more therapeutically effective and patient-friendly formulations.

By considering continuous manufacturing in development, manufacturers ensure they are creating the most optimal path over the life cycle of their program that includes quality, flexibility, and economic benefits. Critical studies to develop a continuous process The first steps to developing a continuous process for an oral solid dose is to

Pfizer CentreOne excels in the development and manufacture of oral solid dosage forms, including highly potent products ... Throughout the development of your oral solid dosage project, our focused studies, advanced analytical technologies and methodologies enable us to help streamline our processes at every stage to align with current industry ...

Oral solid dosage forms are administered for attaining a local therapeutic effect in the mouth, throat, digestive tract or for a systemic effect in the body after oral or gastrointestinal absorption. For preparing oral solid dosage forms, active ingredients and suitable excipients can be milled, dried, encapsulated, blended, granulated or tableted.

Another option in oral solid dosage manufacturing technologies is modified-release. Modified-release dosage forms can consist of coating technologies, which include tablets, softgels, beads, granules, multi-particulates, and microspheres; matrix systems; and osmotic systems.

In addition, oral solids account for nearly 30% of the small molecules in the development pipeline. The oral solid dosage market is expected to continue to grow at a healthy rate, and as a result ...

Polymer-based excipient characterization Polymer-based excipients are used for a variety of functions in oral solid dose drug products, from use as binders to add mechanical strength so that the tablet does not disintegrate during handling and storage, to colorants, taste processing agents or bulking agents to allow the handling of low amounts of API.
