High-temperature polymer dielectrics with high energy density are urgently needed for capacitive energy storage fields. However, the huge conduction loss at elevated temperatures makes the capacitive performance of polymers degrade sharply, limiting the application of them. Herein, the polymer dots (PDs) with high-electron-affinity were introduced into high-temperature polymers ...

Superior high-temperature capacitive performance featuring a high  $U_d$  of 6.6 J/cm<sup>3</sup> under 500 MV/m at 150 °C, along with super fatigue stabilities, are achieved in PEI-based nanocomposites via introducing ultra-low loading volume of MgO-NPs, which is responsible by increased high-field polarizability, dramatically suppressed the conduction current, and greatly ...

It is well known that both the dielectric constant ( $\epsilon_r$ ) (or polarization  $P$ ) and electric breakdown strength ( $E_b$ ) of dielectrics determine the reversible energy storage density ( $W_r$ ) of the capacitors [11], [12]. Many strategies have been employed to enhance the dielectric constant or the breakdown strength of the dielectrics, such as constructing the polymer-based composites ...

# Polymer nanocomposite dielectrics for capacitive energy storage

The burgeoning advancement in renewable energy sources has spurred significant development in energy storage technology [1, 2]. Dielectric capacitors, characterized by their substantial power density and expeditious discharge capability, are widely used in advanced electronic and power systems [[3], [4], [5]]. Particularly, polymer dielectrics are acclaimed for their lightweight, high ...

To meet the urgent demands of high-temperature high-energy-density capacitors, extensive research on high temperature polymer dielectrics has been conducted. 22-26 Typically, there are two main obstacles to the development of high temperature polymer dielectrics. One is the low thermal stability, and the other is the large conduction current under high temperatures ...

Addressing microstructure-property relations of polymer nanocomposites is vital for designing advanced dielectrics for electrostatic energy storage. Here, we develop an integrated phase-field ...

The progress of novel, low-cost, and environmentally friendly energy conversion and storage systems has been instrumental in driving the green and low-carbon transformation of the energy sector [1]. Among the key components of advanced electronic and power systems, polymer dielectrics stand out due to their inherent high-power density, fast charge-discharge rates, and ...

Polymer dielectric capacitors are important for energy storage, although they often suffer from low energy density, especially at high temperatures, and challenges in mass production. This study ...

Polymers are key dielectric materials for energy storage capacitors in advanced electronics and electric power systems due to their high breakdown strengths, low loss, great reliability ...

Polymer nanocomposites dielectric have been widely used in energy storage system as they have enhanced dielectric performance. The polymer nanocomposites have been configured by integrating nanoparticle, which has high permittivity and the polymer matrix of high electric breakdown strength (Ed).

In recent years, various nanoscale approaches have been developed to induce appreciable enhancement in discharged energy density. In this Review, we discuss the state-of-the-art polymer nanocomposites with improved energy density from three key aspects: dipole activity, breakdown resistance and heat tolerance.

Flexible polymer nanocomposites reinforced by high-dielectric-constant ceramic nanofillers have shown great potential for dielectric energy storage applications in advanced electronic and electrical systems. However, it remains a challenge to improve their energy density and energy efficiency at high temperatures above

Meanwhile, the dielectric strength of the nanocomposite suffering from an electrical breakdown can be reinstated to 88% of the initial value. The strategy effectively suppresses electron multiplication effects, enhancing the thermal conductivity and mechanical modulus of dielectric polymers, and thus improving electric energy storage capacity.

The ubiquitous, rising demand for energy storage devices with ultra-high storage capacity and efficiency has drawn tremendous research interest in developing energy storage devices. Dielectric polymers are one of the most suitable materials used to fabricate electrostatic capacitive energy storage devices with thin-film geometry with high power density. In this ...

Introduction. In comparison to currently used energy storage devices, such as electrochemical batteries, polymer film capacitors offer several advantages including ultrafast charge and discharge speed ( $\sim$ ms), ultrahigh power density ( $10^7$  W/kg), and enhanced safety (all-solid-state structure). These characteristics make polymer film capacitors well-suited for ...

Dielectric capacitors have been the major enabler for many applications in advanced electronic and electrical power systems because of their capability for ultrafast charging/discharging and ultrahigh power density. The low energy densities of polymer dielectrics used in these capacitors have not been able to meet the ever-increasing demands for ...

Enhancing the energy storage properties of dielectric polymer capacitor films through composite materials has gained widespread recognition. Among the various strategies for improving dielectric materials, nanoscale coatings that create structurally controlled multiphase polymeric films have shown great promise. This approach has garnered considerable attention ...

In this regard, dielectric capacitors in energy storage devices are a better alternative than electrochemical capacitors and batteries because of their long lifetime, ... 2D filler-reinforced polymer nanocomposite dielectrics for high-k dielectric and energy storage applications. Energy Storage Mater 34:260-281.

With the modern development of power electrification, polymer nanocomposite dielectrics (or nanodielectrics) have attracted significant research attention. The idea is to combine the high dielectric constant of inorganic nanofillers and the high breakdown strength/low loss of a polymer matrix for higher energy density polymer film capacitors. Although ...

Dielectric properties of nanocomposites are affected by phase composition of fillers. Energy storage performances of nanocomposites are significantly improved. Polymer-based nanocomposites always exhibit excellent energy storage capacity and have a great potential to be used in the field of electrical equipment and electronic device.

Polymeric-based dielectric materials hold great potential as energy storage media in electrostatic capacitors. However, the inferior thermal resistance of polymers leads to severely degraded dielectric energy storage capabilities at elevated temperatures, limiting their applications in harsh environments. Here we present a flexible laminated polymer nanocomposite where the ...
