A fault in a power system or circuit is a failure which interferes with the normal flow of current. The faults are associated with abnormal change in current, voltage and frequency of the power system. In general, faults occur in power system networks due to insulation failure of equipments, flashover of lines initiated by a

Using this principle, any unbalanced three-phase system can be represented by three balanced sequence networks. The theory of symmetrical components and the synthesis of sequence networks for three-phase power systems are instrumental for solving most unbalanced problems such as asymmetrical short-circuit and open-circuit faults.
