A solar inverter is really a converter, though the rules of physics say otherwise. A solar power inverter converts or inverts the direct current (DC) energy produced by a solar panel into Alternate Current (AC.) Most homes use AC rather than DC energy. DC energy is not safe to use in homes.

The type of inverter used for solar panels depends on how it is connected to them. You can use string inverters, microinverters, and power optimizers. Once you have wired your solar panels in the desired configuration, you need to connect them to the inverter using the appropriate connectors and cables. Here are the connection steps to follow:

Microinverters are significantly more expensive than string inverters when you start thinking about them on a whole-system basis. If a solar panel system comprising 12 panels had a string inverter, it would cost around \$1,400, whereas if it had a microinverter on each individual panel this would cost closer to \$2,100.

Step-by-Step Guide to Connecting Solar Panels to an Inverter 1. Install the Solar Panels. First, you need to mount the solar panels in a location that gets plenty of sunlight. If you're installing them on your roof, follow these steps: Positioning: Place the panels where they will receive the most sunlight, usually a south-facing roof.
