Because PV technologies use both direct and scattered sunlight to create electricity, the solar resource across the United States is ample for home solar electric systems. However, the amount of power generated by a solar energy system at a particular site depends on how much of the sun's energy reaches it, and the size of the system itself.

Solar panels: Capture energy from the sun. Inverter(s): Converts solar energy into energy that your home can use. Racking equipment: Mounts solar panels to your roof. Monitoring equipment: Tracks the amount of energy your solar panels generate. Solar battery (optional): Stores excess electricity for use later on.

Nearly all solar electric generation was from photovoltaic systems (PV). PV conversion produces electricity directly from sunlight in a photovoltaic cell. Most solar-thermal power systems use steam turbines to generate electricity. EIA estimates that about 0.07 trillion kWh of electricity were generated with small-scale solar photovoltaic systems.
