A power system consists of a number of synchronous machines operating synchronously under all operating conditions. Under normal operating conditions, the relative position of the rotor axis and the resultant magnetic field axis is fixed. The angle between the two is known as the power angle, torque angle, or rotor angle. During any disturbance, the rotor decelerates or accelerates with respect to the synchronously rotating air gap magnetomotive force, creating relative motion. Th...

2 The Swing Equation The swing equation relates the mechanical power and rotations (oscillations in space) to the electrical power and oscillations in time. It describes how the net power into the machine's rotor determines the angle of the rotor. The equations of motion are differential equations (e.g. F = Ma), thus the swing equation will be a
