## System power usage very high windows 10

A "spike" to 17% shouldn't be a very large increase in power draw. Sometimes the GPU can spike very high and exceed what a PSU can provide. Going from memory the 1070 is around a 170W card, but I think some models can hit much higher than that for ms at a time. But that would happen with a high GPU draw, not a 17% load on the CPU.
