# System power usage very high windows 11

the AC power is not enough and it starts draining the internal battery. I have Windows 11 optimized with minimal background tasks ...

Initially I recommend that you check for new updates for Windows 11; Press Windows key + i and go to Windows Update; Click Check for updates and do ALL pending updates; run a disk cleanup; Press Windows key + R and type: cleanmgr press Enter; Click on clean system files and wait for the files to load;

From there, follow the on-screen prompts to run the troubleshooter and restart your PC. Fix 2: Delete Temporary Files. Sometimes, old temporary files on your system can also cause high CPU usage ...

A "spike" to 17% shouldn't be a very large increase in power draw. Sometimes the GPU can spike very high and exceed what a PSU can provide. Going from memory the 1070 is around a 170W card, but I think some models can hit much higher than that for ms at a time. But that would happen with a high GPU draw, not a 17% load on the CPU.

i upgraded to windows 11 in a fresh install, battery life only got worse. so i downgraded with a fresh install of windows 10, latest updates, installed my apps, and everything. ... If your system is showing as very high power usage in Task Manager, it's likely that there is a process or service running in the background that is consuming a lot ...

Introduction. High CPU usage by the "System" process can often be caused by a hardware driver issue (bug, old version, incompatibility etc). The System process loads (or hosts) multiple hardware drivers from different vendors that require higher level of memory access.

Here's how to check CPU usage in Windows 11: Open Task Manager. One way is to search for it from the taskbar. Apps that are using a lot of CPU can now be found at the top of the list. Every program you run on your computer takes up some of the processing power of your CPU, including Windows 11 itself.

2. Disable Connected User Experiences and Telemetry. Connected User Experiences and Telemetry is another service by Microsoft that runs under svchost.exe and is responsible for high disk usage in Windows 11. It basically tracks diagnostic data and sends it to Microsoft's servers. Many users have reported that it's one of the primary culprits behind 100% ...

Cool, but like almost all other laptops i see are not using that much at idle, like my friend's portable 13 inch has a i5 4th gen U processor and at idle it uses about 2% usage with "very low" power usage always, like polar opposites, In hwinformine showing to be drawing at about 8w idle with spikes to 22w, while his is about 2w only, so i think something is running causing the cpu to ...
