Question 17: What is the purpose of the solar panel on satellites? Answer 17: To power the satellite . Question 18: What's the name for the point at which nothing can escape a black hole's gravitational pull? Answer 18: The event horizon

The purpose of solar panels on satellites is that they are used to generate electricity for the spacecraft and its equipment. Solar panels work by converting the energy from the sun into electricity through the use of photovoltaic cells.. This allows satellites to operate for extended periods without the need for a constant supply of fuel to generate power.

The primary limiting factor during flight is the temperature of the solar panels. When a satellite hits the molecules in the Mars atmosphere, the friction heats up the panels, and over-heating the ...

A single solar cell can produce upto 0. 7 W a t t of electricity. So for larger production (and for practical application) a larger number of solar cells are fused together to get solar panel. These solar panels are used in the space station and artificial satellites. Hence, the purpose of the solar panel is to generate a high amount of ...

The solar power satellite was to be located in a geosynchronous orbit, 35,786 kilometres (22,236 mi) above the Earth's surface. NASA 1976. Between 1978 and 1986, the Congress authorized the Department of Energy (DoE) and NASA to jointly investigate the concept. They organized the Satellite Power System Concept Development and Evaluation Program.
