

What planet is visible right now from my location

Mercury is just 5 degrees from the Sun in the sky, so it is difficult or impossible to see it. Venus can best be seen in the hours just after sunset. Visibility improves as the sunlight fades. Venus is visible by day, but may be hard to find. Mars can best be seen in the hours just before sunrise. Visibility deteriorates as the sky gets brighter.

3 days ago Tip 1: Planets are not visible anywhere in the sky. They are visible along the ecliptic. The ecliptic is the path of the sun across the sky. So notice carefully where the sun rises, along which path it moves during the day and where it sets. Planets are visible along this path at night.

See the indispensable Observer's Handbook, from the Royal Astronomical Society of Canada. Visit Stellarium-Web for precise views from your location. Almanac: Bright visible planets (rise and set times for your location). Visit TheSkyLive for precise views from your location.
