Solar power can be used to create new fuels that can be combusted (burned) or consumed to provide energy, effectively storing the solar energy in the chemical bonds. Among the possible fuels researchers are examining are hydrogen, produced by separating it from the oxygen in water, and methane, produced by combining hydrogen and carbon dioxide.

Unlike solar and wind energy, geothermal energy is always available, but it has side effects that need to be managed, such as the rotten egg smell that can accompany released hydrogen sulfide. 1: ...

Once farmland has been converted to solar energy production, many factors should be considered prior to converting the land back to agricultural use. This includes the cost of decommissioning, disposal, or recycling of equipment, restoration of soil fertility, checking for heavy metal levels that might limit plant growth, and checking soil for hardpans. The ...
